Study shows SARS-CoV-2 jumped between people and mink, providing strong evidence of zoonotic transmission

Risk of human-to-wildlife transmission of the COVID-19 virus

Mexico has agreed to host human trials of seven Covid-19 vaccines to strengthen relations with pharmaceutical companies in case limited production capacity leads to a battle for doses.

Mexico uses human trials as path to secure future Covid-19 ...

The zoonotic origin of the SARS-CoV-2 pandemic is still unknown. Animal experiments have shown that non-human primates, cats, ferrets, hamsters, rabbits and bats can be infected by SARS-CoV-2. In addition, SARS-CoV-2 RNA has been detected in felids, mink and dogs in the field. Here, we describe an in-depth investigation of outbreaks on 16 mink farms and humans living or working on these farms ...

Based on the available information there is no clear evidence of human-to-human transmission," read a WHO press release that same day. Also on Jan. 14, Van Kerkhove acknowledged that "it is possible that there is limited human-to-human transmission, potentially among families," but added: "it is very clear right now that we have no sustained human-to-human transmission."

WHO Official Says She Suspected Human-To-Human COVID-19 ...

Mother-to-child, or perinatal, transmission is estimated to account for 15 to 25% of all new infections (95). Worldwide, more than 90% of HIV infections in children are acquired by transmission from mothers to their infants.

Global Impact of Human Immunodeficiency Virus and AIDS ...

Malaria transmission cycle. Malaria spreads when a mosquito becomes infected with the disease after biting an infected person, and the infected mosquito then bites a noninfected person. The malaria parasites enter that person's bloodstream and travel to the liver. When the parasites mature, they leave the liver and infect red blood cells.
