The book gives a fundamental representation of landscape ecology, which proves to be a young, but an interesting and very important trans-disciplinary science for the solution of environmental problems. Both the theoretical basis and practical application of landscape ecology are considered. Great value is attached to describe approaches and experiences from Germany and Central Europe, and to discuss them in an international context. The book is addressed to landscape planners, managers, conservationists and architects, to biologists and geographers, to colleges, universities, authorities, and to the general public being interested in ecological issues. Among the themes are e. g. the roots and the position of landscape ecology, problems of scale and dimension, landscape analysis, diagnosis, potentials, evaluation, change, prognosis, tools like remote sensing and information systems, spatial planning and nature conservation.

This volume provides new conceptual insights to help organizations improve health and wellbeing in society. Some chapters do this by addressing macro-level change, some by highlighting evidence-based change at the micro level, and others by extending theory and integrating perspectives that heretofore have remained separate.

This book provides a wide-ranging review of the current state of teacher education, with contributions by an international group of teacher educators. It focuses on issues confronting teacher educators today and in the coming decade, including the impact of globalization on the profession of teaching, and the need for teacher education to adapt to changing accountability requirements, and establish a set of minimum standards that qualify a person to teach.

Over the last 30 years, water quality management in the United States has been driven by the control of point sources of pollution and the use of effluent-based water quality standards. Under this paradigm, the quality of the nation's lakes, rivers, reservoirs, groundwater, and coastal waters has generally improved as wastewater treatment plants and industrial dischargers (point sources) have responded to regulations promulgated under authority of the 1972 Clean Water Act. These regulations have required dischargers to comply with effluent-based standards for criteria pollutants, as specified in National Pollutant Discharge Elimination System (NPDES) permits issued by the states and approved by the U.S. Environmental Protection Agency (EPA). Although successful, the NPDES program has not achieved the nation's water quality goals of "fishable and swimmable" waters largely because discharges from other unregulated nonpoint sources of pollution have not been as successfully controlled. Today, pollutants such as nutrients and sediment, which are often associated with nonpoint sources and were not considered criteria pollutants in the Clean Water Act, are jeopardizing water quality, as are habitat destruction, changes in flow regimes, and introduction of exotic species. This array of challenges has shifted the focus of water quality management from effluent-based to ambient-based water quality standards. Given the most recent lists of impaired waters submitted to EPA, there are about 21,000 polluted river segments, lakes, and estuaries making up over 300,000 river and shore miles and 5 million lake acres. The number of TMDLs required for these impaired waters is greater than 40,000. Under the 1992 EPA guidance or the terms of lawsuit settlements, most states are required to meet an 8- to 13-year deadline for completion of TMDLs. Budget requirements for the program are staggering as well, with most states claiming that they do not have the personnel and financial resources necessary to assess the condition of their waters, to list waters on 303d, and to develop TMDLs. A March 2000 report of the General Accounting Office (GAO) highlighted the pervasive lack of data at the state level available to set water quality standards, to determine what waters are impaired, and to develop TMDLs. This report represents the consensus opinion of the eight-member NRC committee assembled to complete this task. The committee met three times during a three-month period and heard the testimony of over 40 interested organizations and stakeholder groups. The NRC committee feels that the data and science have progressed sufficiently over the past 35 years to support the nation's return to ambient-based water quality management. Given reasonable expectations for data availability and the inevitable limits on our conceptual understanding of complex systems, statements about the science behind water quality management must be made with acknowledgment of uncertainties. This report explains that there are creative ways to accommodate this uncertainty while moving forward in addressing the nation's water quality challenges.

This classic by an associate of Yugoslavia's Tito created a sensation when it was published in 1957 because it was the first time that a ranking Communist had publicly analyzed his disillusionment with the system.

In this book, one of the leading social theorists and cultural commentators of modern times, turns his gaze on consumption. George Ritzer, author of the famous McDonalidization Thesis, demonstrates the irrational consequences of the rational desire to consume and commodify. He examines how McDonalidization might be resisted, and situates the reader in the new cultural spaces that are emerging in society: shopping malls, casino hotels, Disneyfied theme parks and Las Vegas -- the new `cathedrals of consumption' as he calls them. The book shows how new processes of consumption relate to globalization theory. In illuminating discussions of the work of Thorstein Veblen and the French situationists, Ritzer unearths the roots of problems of consumption in older sociological traditions. He indicates how transgression is bound up with consumption, through an investigation of the obscene in popular and postmodern culture.

The central theme of this book is that the power of public relations is both widely understood and misunderstood, and it is the latter that must be addressed. The book explores how public relations' power is obtained, used and misused in terms of both process and outcomes. The 10 case studies provide excellent examples of the breadth of perspectives and definitions of power that are available to understand power's role in public relations practice.
