Mothers and Others finds the key in the primatologically unique length of human childhood. Renowned anthropologist Sarah Hrdy argues that if human babies were to survive in a world of scarce resources, they would need to be cared for, not only by their mothers but also by siblings, aunts, fathers, friends—and, with any luck, grandmothers. Out of this complicated and contingent form of childrearing, Hrdy argues, came the human capacity for understanding others. In essence, mothers and others teach us who will care, and who will not.

What is language and what is the nature of the intelligence that can acquire it? This volume, originally published in 1976, describes 10 years of research devoted to these questions. The author describes his programmatic research of decomposing language into atomic constituents, designing and applying training programs for teaching these to chimpanzees, and for teaching chimps major human ontological categories, as well as for interrogative, declarative, and imperative sentence forms. The volume details the progress from teaching apes simple predicates such as same–different, to more complex predicates such as if–then, and the success of the program led to the following questions directly related to intelligence: What made the training program effective? What is the cognitive equipment of the species which enables it to learn language? What does this tell us about human intelligence? The answers were suggested in terms of conceptual structure, representational capacity, memory and the ability to handle second-order relations. The results of this experimentation, which resulted in synonymy in some animals, shed light not only on the nature of language, but the nature of intelligence as well. One of the earliest ape language and intelligence studies, today this classic can be read and enjoyed again in its historical context.

One of the strengths of this book is the author's ability to motivate the use of Bayesian methods through simple yet effective examples. - Katie St. Clair MAA Reviews.

The book has been written by an international group of very activeresearchers and scholars who have a passion for the study of Chinese mathematics education. It aims to provide readers with a comprehensiveand updated picture of the teaching and learning of mathematicsinvolving Chinese students from various perspectives, including the ways in which Chinese students learn mathematics in classrooms, schools and homes, the influence of the cultural and socialenvironment on Chinese students' mathematics learning, and the strengths and weaknesses of the ways in which Chinese learnmathematics

This book deals with location problems. Location problems establish a set of facilities (resources) to minimize the cost of satisfying a set of demands (customers) with respect to a set of constraints. There are four components that describe location problems: customers, who are assumed to be already located at points or on routes, facilities that will be located, a space in which customers and facilities are located, and a metric that indicates geographical and chronological distances between customers and facilities. This book describes these parts in each specific location model. Location models are used in a variety of applications such as locating warehouses within a supply chain to minimize the average time to market, locating noxious material to maximize its distance to the public, etc. In this book, readers can find these applications exemplified by real-world cases for each particular model. The relationship between location problems and other areas such as supply chains is also considered here.
