organs, tissues and cells.

## Biology Notes on Immune System | Immunology

Immune systems All animals, including humans, have innate immune systems, which consist of the first and second line of defence measures. The innate immune systems are active continuously or immediately upon infection and the responses occurring as a part of it are the same whether or not the pathogen has been encountered previously.

Biology Immune System Guided - vitaliti.integ.ro

The immune system is made up of specialized organs, cells, and tissues that all work together to destroy these invaders. Some of the main organs involved in the immune system include the spleen, lymph nodes, thymus, and bone marrow. How does it work? The immune system develops all kinds of cells that help to destroy disease causing microbes.

BiologyGuide | AS & A Level Biology Revision

The immune system distinguishes self from nonself and eliminates potentially harmful nonself molecules and cells from the body. The immune system also has the capacity to recognize and destroy abnormal cells that derive from host tissues. Any molecule capable of being recognized by the immune system is considered an antigen (Ag).
