In electrical engineering, capacitive sensing is a technology, based on capacitive coupling, that can detect and measure anything that is conductive or has a dielectric different from air. Many types of sensors use capacitive sensing, including sensors to detect and measure proximity, pressure, position and displacement, force, humidity, fluid level, and acceleration. Human interface devices based on capacitive sensing, such as trackpads, can replace the computer mouse. Digital audio players, mo

Capacitive sensors have been used for a wide range of applications due to their features: low cost, fast response, non-intrusive and non-invasive, no radiation and flexibility in electrode design (Huang et al., 1989; Xie et al., 1990). In a planar capacitive sensor, the sensor electrodes are placed in a co-planar plane.
