Through real-life stories of children and their families, Exceptional Lives provides teachers with a comprehensive experience in special education. Long noted for their focus on inclusion, families, and partnerships, the authors present a realistic look at the workings of special education as future teachers, both general and special educators, will need to know it. Focused on real students with special needs, this book offers strategies and interventions based upon 5 core values: envisioning high expectations, enhancing positive contributions, building on strengths, acting on choices, expanding relationships, and ensuring full citizenship. General K-12 Inservice Teachers and Special Educators.

While being an experiment within itself to teach normative design theory, this comprehensive book treats engineering design as a decision-making process, which it is, from a quantitative point of view. This opens a host of well-developed methods to application, including a mathematically rigorous treatment of risk and uncertainty in design. The book is designed to assist the reader by defining the boundaries of a discipline, providing order for the learning process, and assisting the reader in self testing. Provides a number of new methods and aids to engineering design: Cartoons for identifying system options; Scenario Diagrams for system simulation; an approach to the measurement of information relating to specific decisions; an overall and general approach to engineering design; a rigorous treatment of risk and uncertainty in engineering design, including measures of system value that are valid under risk and uncertainty; and an explanation of the principles of game theory as applied to engineering design.
