Chemical Solution Deposition Science

Chemical solution deposition (CSD) is an overarching term used to describe any technique whereby a chemical precursor solution is used to create a film. Unlike suspensions of material, CSD systems do not contain the actual material that is to be deposited.

Chemical Solution Deposition - an overview | ScienceDirect ...

Chemical solution deposition (CSD) of HTS material represents all chemical deposition methods ranging from sol-gel to metal-organic decomposition (MOD).

Since CSD is no vacuum technology, the major advantage of this process lies in the low investment costs and low energy consumption.

Here, we present a chemical solution deposition methodology to produce 2D arrays of cobalt ferrite (CFO) nanodots on Si substrates. Using thin films of four different self-assembled block copolymers as templates, ordered arrays of nanodots with four different characteristic dimensions were fabricated.

The buffer layers were also prepared by a chemical solution deposition (CSD) route, and this all-CSD route shows good potential for low cost long length industrial production. On single crystal substrates, both TFA- and water-based precursors have been printed, producing well textured coatings with J_c values up to 3 MA cm^{-2} . Multi-filamentary structures and even arbitrary patterns have been successfully prepared, demonstrating the potential for ink-jet printing to directly deposit the ...

The growth of superconducting epitaxial YBCO layers by means of a chemical solution deposition process is a complex one which involves three different stages, as schematically depicted in figure 6: the pyrolysis step, the growth process, and finally the samples are subjected to an oxygenation annealing step. After preparation and deposition of the metal-organic precursor solutions, a first thermal treatment which will pyrolyze all the organic content in the precursor is applied.

This study was the first to realize ferroelectric properties in undoped HfO₂ films by the chemical solution deposition method, which broke the above restrictions while using the ALD method. The evolution of ferroelectricity in pure HfO₂ films was studied over a wide range of thickness from 34 nm to 136 nm, without doping any other metallic elements.
