These signals can be described with the help of probability and other concepts in statistics. Particularly the signal under observation is considered as a realization of a random process or a stochastic process. The terms random processes, stochastic processes and random signals are used synonymously.

PROBABILITY THEORY AND STOCHASTIC PROCESS

In probability theory and related fields, a stochastic or random process is a mathematical object usually defined as a family of random variables. Many stochastic processes can be represented by time series. However, a stochastic process is by nature continuous while a time series is a set of observations indexed by integers.

A stochastic integral is defined in the sense of convergence in probability and gives a sufficient condition for its existence. A process $X(t)$ is said to be homogeneous if the distribution function of the increment $X(t + \tau) - X(t)$ depends only on the length τ of the interval but is independent of the endpoint t .
