Having an understanding of critical appraisal and evidence-based medicine is a prerequisite to being an effective clinician.? However, critical appraisal is often taught by people not involved in day-to-day clinical care, meaning the clinical relevance is not always brought to the fore. This book takes a different approach. It is written by clinicians, for clinicians. It takes the reader step by step through the process so that any journal article can be easily read, evidence

evaluated and the results - and their reliability - truly understood. By integrating this with knowledge of local skills and resources and patient preference, the reader will be able to apply the best possible care that his or her patients deserve. This accessible book is suitable for undergraduates and postgraduates of all medical specialties, nursing, paramedics, pharmacists and all allied health professions. It is the ideal reference for anyone needing help writing a clinical topic review, reviewing a paper in a journal club or preparing for a critical appraisal exam. But most importantly, it is essential for those who wish to practice medicine in the best possible way for their patients, using the best evidence, tailored to the individual.

This book presents a logical system of critical appraisal, to allow readers to evaluate studies and to carry out their own studies more effectively. This system emphasizes the central importance of cause and effect relationships. Its great strength is that it is applicable to a wide range of issues, and both to intervention trials and observational studies. This system unifies the often different approaches used in epidemiology, health services research, clinical trials, and evidence-based medicine, starting from a logical consideration of cause and effect. The author's approach to the issues of study design, selection of subjects, bias, confounding, and the place of statistical methods has been praised for its clarity and interest. Systematic reviews, meta-analysis, and the applications of this logic to evidence-based medicine, knowledge-based health care, and health practice and policy are discussed. Current and often controversial

examples are used, including screening for prostate cancer, publication bias in psychiatry, public health issues in developing countries, and conflicts between observational studies and randomized trials.

Statistical issues are explained clearly without complex mathematics, and the most useful methods are summarized in the appendix. The final chapters give six applications of the critical appraisal of major studies: randomized trials of medical treatment and prevention, a prospective and a retrospective cohort study, a small matched case-control study, and a large case-control study. In these chapters, sections of the original papers are reproduced and the original studies placed in context by a summary of current developments.

tabulated explanations are based on the authors' popular medical statistics courses. Critical appraisal guidelines at the end of each chapter help the reader evaluate the statistical data in their particular contexts.
