Electronic Compression Ignition Engine Management Systems

Compression ignition occurs when the engine compression is great enough where, if the fuel is injected into the cylinder on the compression stroke, the fuel will spontaneously ignite because of the temperature the air has risen to, due to the compression of the engine. Any gas, including air will get hot when it is compressed.

Compression ignition engine or CI engine is an internal combustion engine in which ignition of the fuel takes place with the help of hot compressed air. As the air is compressed, it gets hot and its heat is used for the ignition and burning of the fuel. In this engine the air is sucked during suction stroke and then this air is compressed while compression stroke.

Compression Ignition Engine - Definition, Main Components ...

Before ECUs, air – fuel mixture, ignition timing, and idle speed were mechanically set and dynamically controlled by mechanical and pneumatic means. If the ECU has control over the fuel lines, then it is referred to as an electronic engine management system (EEMS). The fuel injection system has the major role of controlling the engine's fuel supply. The whole mechanism of the EEMS is controlled by a stack of sensors and actuators.

The PCM uses this information to regulate a wide variety of ignition, fuel and emission control functions. When the engine is cold, for example, the fuel mixture needs to be richer to improve drivability. Once the engine reaches a certain temperature, the PCM starts using the signal from the O2 sensor to vary the fuel mixture.

Whereas in case of diesel (Compression Ignition—CI) engines only air is taken in during suction operation and is compressed during compression operation and just before the end of compression, when diesel fuel is injected it gets ignited due to heat of compression of air.

Ignition Systems: Intro, Types and Electronic Ignition ...

The diesel engine, named after Rudolf Diesel, is an internal combustion engine in which ignition of the fuel is caused by the elevated temperature of the air in the cylinder due to the mechanical compression (adiabatic compression); thus, the diesel engine is a so-called compression-ignition engine (CI engine). This contrasts with engines using spark plug-ignition of the air-fuel mixture, such ...
