For read operations, the data is sampled on the rising edge of the last clock cycle. For write operations, valid data appears on the bus before the end of the cycle, as shown in the timing diagram. While the timing diagram indicates that the data needs to be sampled on the rising clock, on most systems it remains valid for the entire clock cycle.

When this signal is active the system DMA controller has control of the address, data, and read/write signals. This signal should be included as part of ISA board select decodes to prevent incorrect board selects during DMA cycles. SD0 to SD15 System Data serves as the data bus bits for devices on the ISA bus. SD15 is the most significant bit.

ISA = Industry Standard Architecture This file is designed to give a basic overview of the bus found in most IBM clone computers, often referred to as the XT or AT bus. The AT version of the bus is upwardly compatible, which means that cards designed to work on an XT bus will work on an AT bus.
