In the Java SE environment, the services might be provided by a standalone CDI implementation like Weld (see Section 18.4.1, \u0026 CDI SE Module), or even by a container that also implements the subset of EJB defined for embedded usage by the EJB 3.2 specification. CDI is especially useful in the context of web application development,

CDI is fully integrated into the Java EE environment. Beans have access to Java EE resources and JPA persistence contexts. They may be used in Unified EL expressions in JSF and JSP pages. They may even be injected into other platform components, such as servlets and message-driven Beans, which are not beans themselves.

WeldInstance is automatically available in Weld SE and Weld Servlet where the Weld API is always on the class path. It is also available in Weld-powered EE containers. In this case, users would have to compile their application against the Weld API and exclude the Weld API artifact from the deployment (e.g. use *provided* scope in Maven).

You have a managed bean IUserHolder (a top-level Java class) and producer method for the same bean type and qualifiers (SecurityManager.getUserHolder()). There are several ways to solve this. One of which is to "disable" the managed bean with @Vetoed annotation. Read the spec and Weld docs to find the solution most suitable for your needs See also:
