This IBM Redbooks publication can help you plan and perform the migration of your J2EE applications that are developed for WebSphere Application Server Community Edition V1.1.0.1, enabling them to run on WebSphere Application Server V6.1 - Network Deployment. It includes migration strategy considerations for developing portable applications as well as working migration examples. This book discusses some of the most common migration issues that you might encounter when migrating from J2EE platforms to WebSphere Application Server V6.1. In this book, we use two sample applications to demonstrate how to migrate your J2EE applications. We migrate each application using a different approach and different development tools. In one migration, we use Rational Application Developer V7.0 and, in the other, we use the Application Server Toolkit, which comes with WebSphere Application Server V6.1 - Base. We also describe step-by-step how we built and configured our environment for these migration examples. The audience for this book includes administrators and developers that seek a process and instructions for migrating from WebSphere Application Server Community Edition to the WebSphere Application Server Basic and Network Deployment editions.

This IBM® Redbooks® publication helps you plan and execute the migration of J2EE applications developed for Oracle WebLogic Server, JBoss, GlassFish, and Apache Tomcat, so that they run on WebSphere® Application Server V7. This book provides detailed information to plan migrations, suggested approaches for developing portable applications, and migration working examples for each of the platforms from which we migrated. It is not our intention to provide a feature-by-feature comparison of these application servers versus WebSphere Application Server V7, or to argue the relative merits of the products, but to produce practical technical advice for developers who have to migrate applications from these vendors to WebSphere Application Server V7. The book is intended as a migration guide for IT specialists who are working on migrating applications written for other application servers to WebSphere Application Server V7.

There are many reasons why you would want to optimize your servers through virtualization using Linux on IBM® System z®: Too many distributed physical servers with low utilization A lengthy provisioning process that delays the implementation of new applications Limitations in data center power and floor space High total cost of ownership (TCO) Difficulty allocating processing power for a dynamic environment This IBM Redbooks® publication provides a technical planning guide and example for IT organizations to migrate from their x86 environment to Linux on System z. It begins by examining the benefits of migrating workloads to Linux on System z. Here, we describe the workload centric method of information technology and then discuss the benefits of migrating workloads to Linux on System z. Next, we describe total cost of ownership analyses and we guide you in understanding how to analyze your environment before beginning a migration project. We also assist you in determining the expected consolidation ratio for a given workload type. We also describe virtualization concepts along with describing the benefits of migrating from the x86 environment to guests residing on an IBM z/VM® single system image with live guest relocation. This IBM Redbooks publication walks you through a migration approach, includes planning worksheets, as well as a chapter to assist you in analyzing your own systems. We also discuss post migration considerations such as acceptance testing of functionality and performance measurements.
