If you want to use logic IC's for an astable timer circuit, it's in there. Just plug in the clipping, adjust for whatever output you need, adjust for your own power supply, and you're done. With a tiny bit of electronic background, this whole series is fantastic. Also got my brain around working a few things out a different way.

Newnes Linear IC Pocket Book is aimed at all engineers, technicians, students and experimenters who can build a design directly from a circuit diagram. In a highly concise form Ray Marston presents a huge compendium of circuits that can be built as they appear, adapted or used as building blocks. The devices used have been carefully chosen for their ease of availability and reasonable

price. The selection of devices has been thoroughly reviewed for the second edition, which contains approximately 350 new diagrams. Marston deals mainly with strictly-linear ICs such as op-amps, pre-amplifiers, power amplifiers, signal-conditioners and power supply regulators, as well as various hybrid types: the 555 timer IC, bar-graph display drivers, CCD delay lines, function or wave form generators, phase-locked loops and power control ICs. The subjects are treated in an easy-to-read, highly practical manner with a minimum of mathematics. Ray Marston has proved, through hundreds of circuits articles and books, that he is one of the world's leading circuit designers and writers. He has written extensively for Electronics World, Nuts and Bolts, Electronics and Beyond, Popular Electronics, Electronics Now, Electronics Today International, and Electronics Australia, amongst others. All parts readily available from major suppliers. Packed with ready-to-build circuit designs. Handy reference for hobbyists, students and circuit designers.

Passive components and discrete devices form the bedrocks on which all modern electronic circuits are built. This Pocket Book is a single volume applications guide to the most popular and useful of these devices, containing 670 diagrams, tables and carefully selected practical circuits. Throughout the Pocket Book great emphasis is placed on

practical user information and circuitry. All of the active devices used are modestly priced and readily available. The book is split into twenty chapters. The first three explain important practical features of the ranges of modern passive electrical components, including relays, meters, motors, sensors and transducers. Chapters 4 to 6 deal with the design of practical attenuators, filters, and 'bridge' circuits. The remaining fourteen chapters deal with specific types of discrete semiconductor device, including various types of diode, transistors, JFETs, MOSFETs, VMOS devices, UJTs, SCRs, TRIACs, and various optoelectronic devices. This easy-to-read, concise, highly practical and largely non-mathematical volume is aimed directly at engineers, technicians, students and competent experimenters who can build a design directly from a circuit diagram, and if necessary modify it to suit individual needs. Ray Marston is the author of the multi-volume series of Newnes Circuits Manuals. His magazine articles on circuit design appear regularly in a wide range of publications worldwide.

A vast range of audio and audio-associated ICs are readily available for use by design engineers and technicians. This handbook is a comprehensive guide to the most popular and useful of these devices, including about 370 circuits with diagrams. It deals with ICs such as low frequency linear amplifiers, dual

pre-amplifiers, audio power amplifiers, charge coupled device delay lines, bar-graph display drivers, and power supply regulators. It shows how to use these devices in circuits ranging from simple signal conditioners and filters to complex graphic equalisers, stereo amplifier systems, and echo/reverb delay line systems. Not only does this Handbook contain a huge collection of circuits using state-of-the-art and readily available ICs, but also it gives a thorough grounding in theoretical information relating to the various aspects of modern audio systems and to various dedicated types of audio ICs. Newnes Circuits Manuals and User's Handbooks by Ray Marston cover a wide range of electronics subjects in an easy-to-read and non-mathematical manner, presenting the reader with many practical applications and circuits. They are specifically written for the practising design engineer, technician, and the experimenter, as well as the electronics students and amateur. The ICs and other devices used in the practical circuits are modestly priced and readily available types, with universally recognised type numbers. Ray Marston has proved, through hundreds of circuits articles and books, that he is one of the leading circuit designers and writers in the world. He has written extensively for Popular Electronics, Electronics Now, Electronics and Beyond, Electronics World, Electronics Today International and Electronics Australia, amongst others. Other

Newnes Radio and Electronics Engineer's  
Pocket Book, Fifteenth Edition provides  
reference of the information relevant in  
radio and electronics engineering. The book  
presents tables, illustrations, and diagrams  
of various data used in radio and electronics  
engineering. The coverage of the text  
includes abbreviations and symbols,  
electrical equations, and code conversions.  
The text will be useful to engineers,  
technicians, and other professionals who  
require a reference about the different  
aspects of radio and electronics.

- Explains electronics from fundamentals to applications - no other book has such breadth of coverage
- Approachable, clear writing style with minimal math - no previous knowledge of electronics required!
- Now fully revised and updated to include coverage of the latest developments in electronics: Blu-ray, HD, 3D TV, digital TV and radio, miniature computers, robotic systems and more

Electronics Simplified (previously published as Electronics Made Simple) is essential reading for students embarking on courses involving electronics, anyone whose job involves electronic technology or equipment, and anyone who wants to know more about the electronics revolution. No previous knowledge is assumed and by focusing on how systems work, rather than on details of circuit diagrams and calculations, this book introduces readers to the key principles and technology of modern electronics without needing access to expensive equipment or laboratories. This approach also enables students to gain a firm grasp of the principles they will be applying in the lab.

This well-known book is an essential tool for every service engineer, and an extremely useful reference source for a wide range of engineers, students, sales and installation staff. It presents a wide range of data and key information in a compact form, covering television reception, satellite and cable television, video recorders, colour camera technology, teletext, sound systems, fault-finding procedures and much more. The new edition has been thoroughly updated to include digital and other new technologies, with new chapters on digital camcorders and VCRs, digital television, Dolby sound systems, and home cinema. Eugene Trundle is well known as a contributor to Television and other magazines, and as author of a number of books on servicing and TV technology. He also works in the servicing industry, so his writing is based on hands-on experience. Well known and essential tool for every service engineer Contains wide range of data and essential information in a compact form Thoroughly updated to cover the latest technology such as digital TV and video technology
