Threat modeling is a practice that shifts security as far to the left as possible. Threat modeling can occur as early as the planning stages within the software development life cycle (SDLC). Threat modeling lends itself to staying proactive instead of waiting until an incident occurs to react.

~~Designing for Security With Threat Modeling ...~~

Threat modeling is a type of risk analysis used to identify security defects in the design phase of an information system. Threat modeling is most often applied to software applications, but it can be used for operating systems and devices with equal effectiveness. Threat modeling is typically attack-centric; threat modeling most often is used to identify vulnerabilities that can be exploited by an attacker in software applications.

~~What Is Security Threat Modeling? —dummies~~

Threat Modeling: A systematic & structured security technique, used to identify the security objectives, threats & vulnerabilities of an application, to help make design and engineering decisions, and determine where to prioritize efforts in designing, developing and deploying secure applications It's a day-to-day phenomenon for all of us

~~Advanced Threat Modelling Knowledge Session~~

Threat modeling is a family of activities for improving security by identifying objectives and vulnerabilities, and then defining countermeasures to prevent, or mitigate the effects of, threats to the system. A threat is a potential or actual undesirable event that may be malicious (such as DoS attack) or incidental (failure of a Storage Device).

~~Threat Modeling | OWASP~~

The Microsoft Threat Modeling Tool makes threat modeling easier for all developers through a standard notation for visualizing system components, data flows, and security boundaries. It also helps threat modelers identify classes of threats they should consider based on the structure of their software design.

~~Microsoft Security Development Lifecycle Threat Modelling~~

Threat Modeling: Designing for Security combines both technical detail with pragmatic and actionable advice as to how you can implement threat modeling within your security program. Threat modeling increases assurance and offers a standard and structured way to answer "just how secure is this application or infrastructure?"

~~Threat Modeling: Designing for Security: Shostack, Adam ...~~

Threat modeling is a highly undervalued, often overlooked aspect of building secure applications—which is a shame, because you don't have to be a large enterprise with hundreds of developers and architects to benefit from threat modeling. It helps organizations of all sizes.

~~Threat Modeling: Designing for Security | Carve Systems~~

The purpose of threat modeling is to provide defenders with an analysis of what controls or defenses need to be included, given the nature of the system, the probable attacker's profile, the most likely attack vectors, and the assets most desired by an attacker.
