Study of cells that covers the outside of the body (for example, skin), the organs (for example, pericardium), internal passageways that lead to the exterior of the body (for example, abdominal mesenteries), and the lining of the moveable joint cavities. There are two basic types of tissue membranes: connective tissue and epithelial membranes (Figure 3).

## Types of Tissues | Anatomy and Physiology I

The study of the shape and arrangement of cells in tissue is called histology. All cells and tissues in the body derive from three germ layers in the embryo: the ectoderm, mesoderm, and endoderm. Different types of tissues form membranes that enclose organs, provide a friction-free interaction between organs, and keep

## 4.1 Types of Tissues □ Anatomy and Physiology

Epithelium consists of closely packed, flattened cells that make up the inside or outside lining of body areas. There is little intercellular material. The tissue is avascular, meaning without blood vessels. Nutrient and waste exchange occurs through neighboring connective tissues by diffusion. The upper surface of epithelium is free, or exposed to the outside of the body or to an internal body cavity.

Human anatomy deals with anatomical structures of the human body, including cells, tissues, organs, and organ systems. Anatomy is always linked to physiology, the study of how biological processes function in living organisms. Therefore it is not enough to be able to identify a structure, its function must also be understood.

Gross anatomy is subdivided into surface anatomy (the external body), regional anatomy (specific regions of the body), and systemic anatomy (specific organ systems). Microscopic anatomy is subdivided into cytology (the study of cells) and histology (the study of tissues). Anatomy is closely related to physiology (study of function), biochemistry (chemical processes of living things), comparative anatomy (similarities and differences between species), and embryology (development of
