Solubility is the property of a solid, liquid or gaseous chemical substance called solute to dissolve in a solid, liquid or gaseous solvent.The solubility of a substance fundamentally depends on the physical and chemical properties of the solute and solvent as well as on temperature, pressure and presence of other chemicals (including changes to the pH) of the solution.

Solubility - Wikipedia
In organometallic chemistry, a coordinatively unsaturated complex has fewer than 18 valence electrons and thus is susceptible to oxidative addition or coordination of an additional ligand. Unsaturation is characteristic of many catalysts. The opposite of coordinatively unsaturated is coordinatively saturated.

Saturated and unsaturated compounds - Wikipedia
Unsaturated hydrocarbons are hydrocarbons that have double or triple covalent bonds between adjacent carbon atoms. The term 'unsaturated' means more hydrogen atoms may be added to the hydrocarbon to make it saturated. The configuration of an unsaturated carbons include straight chain, such as alkenes and alkynes, as well as branched chains and aromatic compounds. Except for aromatic compounds, unsaturated hydrocarbons are mostly reactive and undergo multiple reactions to their multiple bonds.

Unsaturated hydrocarbon - Wikipedia
An unsaturated solution is a chemical solution in which the solute concentration is lower than its equilibrium solubility. All of the solute dissolves in the solvent. When a solute (often a solid) is added to a solvent (often a liquid), two processes occur simultaneously. Dissolution is the dissolving of the solute into the solvent.

Saturation - Wikipedia
Stearic acid is a saturated fatty acid (with only single bonds) found in animal fats, and is the intended product in full hydrogenation. Oleic acid has a double bond (thus being "unsaturated") with cis geometry about midway in the chain; it makes up 55-80% of olive oil.. Elaidic acid is its trans isomer; it may be present in partially hydrogenated vegetable oils, and also occurs in the fat ...

Unsaturated solution - definition of unsaturated solution ...
Unsaturated solutions are solutions in which the amount of dissolved solute is less than the saturation point of the solvent (at that specific temperature gradient). If the amount of dissolved solute is equal to the saturation point of the solvent, the solution is called a saturated solution.

Unsaturated Solutions | Unsaturated solutions with ...
An unsaturated solution is one that still has a capacity to dissolve more solute. Any such solution, is in a condition where it still hasn't reached the saturation limit. An example is NaCl in water. When you add a teaspoonful of salt to a glass of water, it easily dissolves in it.

What are examples of unsaturated solutions? - Quora
Unsaturated solutions are solutions that contain less solute than the actual amount of solute that the solvent can dissolve. If more solutes can be dissolved in the solution, the solution is still considered unsaturated.

Unsaturated | Definition of Unsaturated at Dictionary.com
Unsaturated solutions are solutions that have the capacity of dissolving more solutes in them. These solutions are yet to pass their saturation point hence would never carry a precipitate at the bottom.

Difference Between Saturated and Unsaturated Solutions ...
You can prepare it from scratch, saturate an unsaturated solution, or force a supersaturated solution to lose some solute. Add solute to a liquid until no more dissolves. Evaporate solvent from a solution until it becomes saturated. Once the solution starts to crystallize or precipitate, the solution is saturated.

Saturated Solution Definition and Examples
An unsaturated solution is a solution that contains less than the maximum amount of solute that is capable of being dissolved. The figure below illustrates the above process and shows the distinction between unsaturated and saturated. Figure 1. When 30.0 g of NaCl is added to 100 ml of water, it all dissolves, forming an unsaturated solution.
