If you know how FLSM Subnetting works and how it is done, you already know the 90% of VLSM Subnetting. In FLSM, all subnets use same block size, thus Subnetting is required only one time. In VLSM, subnets use block size based on requirement, thus Subnetting is required multiple times. The concept of VLSM Subnetting is relatively simple. Select block size for each segment.

VLSM Subnetting Explained with Examples

The subnet 192.168.1.224 /29 with the Mask 255.255.255.248 has exactly 6 valid host IP addresses. So this can be assigned to Management. The last octet of the subnet mask will contain 11111000. By using VLSM, the administrator can subnet the IP subnet in such a way that least number of IP addresses are wasted.

For example, for the first scenario, let's say we have exactly 252 users total and we need to assign 126 users to the 1st subnet, and the other 126 users to the 2nd subnet, this works out perfectly because a subnet mask of 255.255.255.128, as we know, gives us exactly 126 usable addresses per subnet... that's great!... there is no much room for future growth though... hmm.

A quick way to find out the correct answers is notice that all 255.255.255.x subnet masks will separate these two IP addresses into two separate subnets so we need a Layer 3 device here and each interface must require an IP address on a unique IP subnet -> A, C are not correct while B, D are correct.

Because we have different subnet sizes, we need to calculate the subnet mask for each subnet. To find the subnet mask you can use this trick: $256 - \text{subnet size} = \text{subnet mask}$. Subnet 1: $256 - 64 = 192$ so the subnet mask is 255.255.255.192; Subnet 2: $256 - 32 = 224$ so the subnet mask is 255.255.255.224

Answer & Solution. Answer: Option B. Solution: The mask 255.255.254.0 (/23) used with a Class A address means that there are 15 subnet bits and 9 host bits. The block size in the third octet is 2 (256 - 254). So this makes the subnets in the interesting octet 0, 2, 4, 6, etc., all the way to 254.
