Mechanical fuel injection works with a simple throttle-controlled air valve and a fuel pump, usually running at one-half engine speed. After pulling fuel from a vented fuel tank, the fuel is delivered through a barrel valve that controls the amount of

An accumulator can be thought of as something that stored fuel temporarily. Then the metering control unit of the system comes into the picture.

fuel and air must be mixed very precisely, with the right amount of both. This is achieved by using the flap valve, which is located inside the air intake of the engine. It lets the fuel come in the correct flow to be mixed with the air in the right amount.

A lot of folks confuse a mechanical fuel injection system with a carburetor. While the principle is fundamentally similar, there is a major difference in the type of fuel delivered to the engine. Whereas carburetor systems deliver low pressure fuel from the gas tank, a mechanical fuel injector

It follows a fairly straightforward process to do so: The fuel exits the fuel tank via the fuel pump. It travels through fuel lines towards the engine. The fuel pressure regulator constricts the flow of fuel and only lets a calculated amount through to the injectors.
